ZIFO

PRODUCT KNOWLEDGE BASE

Product Portfolio, Capabilities, Architecture and Product Policies

Document Owner	Product Management
Document Classification	Internal Product Knowledge
Version	1.0
Effective Date	20 August 2026
Review Cycle	Quarterly or upon material product release
Organization	ZIFO
Products Covered	ZIFO Assist, ZIFO Connect, ZIFO Insight
Primary Audience	Sales, Solutions, Support, Customer Success, Engineering and AI Systems

1. Product Portfolio Overview

ZIFO provides enterprise software products designed to connect business systems, deploy knowledge-driven artificial intelligence experiences and improve decision-making through governed analytics. The portfolio supports modular adoption and integration with existing enterprise technology landscapes.

Product	Primary Business Purpose	Primary Users
ZIFO Assist	Enterprise AI assistants and knowledge-driven automation	Business users, service teams, employees and custor
ZIFO Connect	Enterprise integration and workflow connectivity	IT, integration and operations teams
ZIFO Insight	Analytics, operational intelligence and decision support	Business leaders, analysts and operations teams

2. Common Product Principles

• Enterprise-ready architecture with role-based access and configurable governance.

• API-first integration to support existing enterprise applications.

• Modular deployment based on customer requirements and solution scope.

• Operational monitoring and audit capabilities appropriate to the deployed environment.

• Configuration and access controls designed to support customer security requirements.

3. Product 1 — ZIFO Assist

Product Summary

ZIFO Assist is an enterprise artificial intelligence platform for building knowledge-grounded conversational assistants and workflow-enabled AI experiences. It enables organizations to provide users with contextual answers from approved business knowledge while connecting selected enterprise workflows and systems.

Business Problems Addressed

• Employees spend excessive time searching across multiple documents and systems.

• Customer and support teams require faster access to accurate business information.

• Knowledge is distributed across documents, portals, databases and applications.

• Organizations require controlled adoption of generative AI with governance and security controls.

Core Capabilities

Capability	Description
Knowledge Retrieval	Retrieves relevant information from approved enterprise knowledge sources using semantic, keyword o
RAG Orchestration	Combines retrieval, context assembly and language-model interaction to generate grounded responses
Multi-Source Ingestion	Supports approved documents, structured data sources, APIs and enterprise knowledge repositories.
Conversation Context	Maintains permitted session and conversational context to improve relevance.
AI Guardrails	Supports controls for prompt injection detection, sensitive data handling, scope validation and output ch
Workflow Actions	Can invoke approved business actions through APIs, tools or workflow integrations.
Human Handover	Supports escalation to human teams when automation confidence or authorization is insufficient.
Observability	Provides operational logging, usage monitoring and evaluation support.

Reference Architecture

• Experience Layer: web, employee portals, customer portals and approved enterprise channels.

• AI Orchestration Layer: prompt management, context routing and workflow coordination.

• Retrieval Layer: vector, keyword or hybrid retrieval and reranking.

• Knowledge Layer: documents, structured business data and governed enterprise content.

• Governance Layer: authentication, authorization, guardrails and audit logging.

Product Policies

• Only approved knowledge sources shall be enabled for production retrieval.

• Knowledge source owners are responsible for content accuracy and lifecycle management.

• Access controls shall be applied before restricted information is returned.

• High-impact transactions require appropriate authorization and approval controls.

• Unsupported information shall not be generated as factual company information.

Typical Use Cases

• Internal employee knowledge assistant.

• Customer support assistant.

• Contact center agent assist.

• Policy and procedure search.

• Document intelligence and question answering.

• Sales and proposal knowledge assistance.

Product FAQs

Can ZIFO Assist answer using company documents?
Yes. ZIFO Assist supports approved enterprise knowledge ingestion and Retrieval-Augmented Generation workflows.

Can it perform actions?
Yes. Approved workflow actions can be integrated through APIs, tools and enterprise services with appropriate authorization.

Does it support guardrails?
Yes. Guardrails can address security, scope, sensitive information and output quality requirements.

4. Product 2 — ZIFO Connect

Product Summary

ZIFO Connect is an enterprise integration and connectivity platform that enables applications, business processes and data services to exchange information through managed interfaces. It is designed to reduce point-to-point integration complexity and provide centralized visibility over enterprise connectivity.

Business Problems Addressed

• Business applications operate in isolated technology environments.

• Point-to-point integrations are difficult to maintain and scale.

• Teams lack visibility into integration failures and processing status.

• Manual data exchange creates delays and operational risk.

Core Capabilities

Capability	Description
API Management	Publishes and manages approved application programming interfaces for enterprise services.
Event Processing	Supports asynchronous event-driven communication for decoupled business processes.
Workflow Orchestration	Coordinates multi-step processes across connected systems.
Connector Framework	Provides reusable connectors and adapters for supported applications and services.
Data Transformation	Maps and transforms data formats between source and destination systems.
Monitoring	Tracks integration health, execution status and operational exceptions.
Error Handling	Supports retry, exception routing and controlled recovery patterns.
Security Controls	Supports authentication, authorization and secure credential handling.

Reference Architecture

• API Layer: controlled interfaces for enterprise services.

• Event Layer: asynchronous event-driven communication.

• Orchestration Layer: workflow coordination and business rules.

• Transformation Layer: mapping and conversion between data formats.

• Operations Layer: monitoring, retries and exception management.

Product Policies

• Production integrations shall have identified owners and support responsibilities.

• Credentials and secrets shall not be embedded directly in source code.

• Interfaces shall define payload, authentication and error requirements.

• Critical integration changes shall follow approved release and change-management processes.

• Customer data exchanged between systems shall follow applicable data protection controls.

Typical Use Cases

• CRM and ERP integration.

• Contact center and ticketing integration.

• Customer data synchronization.

• Order and workflow orchestration.

• API enablement.

• Event-driven business processes.

• Centralized integration monitoring.

Product FAQs

Can ZIFO Connect integrate cloud and on-premises systems?
Deployment and integration architecture can support approved environments and connectivity patterns.

Does it support real-time integration?
Yes. API, event and webhook patterns can support real-time or near-real-time processing.

How are failed integrations handled?
Configured monitoring, retries, error handling and exception workflows provide controlled operational recovery.

5. Product 3 — ZIFO Insight

Product Summary

ZIFO Insight is an enterprise analytics and operational intelligence platform that combines governed data, business metrics and decision-support experiences. It helps organizations move from fragmented reporting toward consistent, role-based business visibility.

Business Problems Addressed

• Business information is distributed across multiple applications.

• Teams use inconsistent definitions for important business metrics.

• Operational decisions are delayed because reporting is manual.

• Leadership lacks consolidated visibility into business indicators.

Core Capabilities

Capability	Description
Data Integration	Ingests approved data from operational systems and analytical sources.
Data Modeling	Creates governed data models and relationships for reporting and analysis.
Semantic Metrics	Defines reusable business measures and metric terminology.
Dashboards	Provides configurable views for operational and management reporting.
Operational Alerts	Supports rule-based notifications for defined business conditions.
Analytics Exploration	Enables authorized users to investigate trends, segments and dimensions.
Role-Based Views	Presents information based on user role and permitted business scope.
AI-Assisted Insights	Supports approved natural-language analysis and summarization capabilities.

Reference Architecture

• Data Layer: raw and curated data from approved sources.

• Transformation Layer: cleansing, standardization and business transformation.

• Semantic Layer: shared definitions for metrics, entities and relationships.

• Analytics Layer: dashboards, reports, alerts and analytical experiences.

• Access Layer: authentication and role-based authorization.

Product Policies

• Business-critical metrics shall have defined owners and documented calculation logic.

• Official metric definitions shall follow controlled governance.

• Access to dashboards and datasets shall follow role and data classification.

• Data quality issues shall be documented and escalated.

• AI-assisted insights should be validated before material business decisions.

Typical Use Cases

• Executive performance dashboards.

• Sales and pipeline intelligence.

• Customer service analytics.

• Campaign performance analysis.

• Workforce and productivity monitoring.

• Customer and operational trend analysis.

• Enterprise KPI governance.

Product FAQs

Can ZIFO Insight combine data from multiple systems?
Yes. The platform supports governed integration of approved business data sources.

Can users see different information?
Yes. Role-based views and access controls can be configured according to business scope.

Does it support AI-based analysis?
Yes. AI-assisted natural-language exploration and insight generation can be enabled.

6. Product Comparison

Area	ZIFO Assist	ZIFO Connect	ZIFO Insight
Primary Focus	AI and knowledge	System connectivity	Analytics and intelligence
Primary Users	Employees, customers, service teams	IT and integration teams	Business leaders and analysts
Key Input	Knowledge and context	Events, APIs and workflows	Business and operational data
Primary Output	Answers and assisted actions	Reliable information exchange	Metrics, insights and dashboards
Typical Value	Faster knowledge access and automation	Reduced integration complexity	Improved visibility and decision-making

7. Cross-Product Integration

The ZIFO product portfolio is designed for complementary use. ZIFO Connect provides controlled connectivity between enterprise systems. ZIFO Assist can use approved knowledge and invoke authorized actions through integrations. ZIFO Insight consumes governed operational data to provide visibility and decision support.

Example enterprise flow: a user asks ZIFO Assist about a business issue; ZIFO Assist retrieves approved knowledge, ZIFO Connect invokes an authorized workflow when an action is required, and ZIFO Insight provides operational metrics for monitoring the process.

8. Product Support and Lifecycle Policy

• Product support is provided according to the customer's contracted support plan.

• Product enhancements are prioritized based on business value, strategic alignment, security, customer demand and technical feasibility.

• Security vulnerabilities are assessed and prioritized according to risk.

• Customers shall be informed of material changes requiring action where applicable.

• Product documentation shall be reviewed when material functionality changes are released.

9. Product Information Governance

Product Management owns the accuracy and lifecycle of product positioning, capability descriptions and official product information. Engineering owns technical implementation information. Customer Success and Support contribute operational knowledge and known issue information. Material product content changes shall be reviewed before publication to official knowledge channels.

10. RAG Metadata Recommendations
